Problem3:

I. The class Integer cannot be inherited from. This is because there no suitable constructor found.

II. If we were able to extend this class, it could potentially be detrimental to the class. This is very low-level so if we were able to randomly override any method it would mess up a lot of other low-level things.

III. A solution to the problem would be to implement the same classes which that Number implements. So implementing: *Comparable, Constable, ConstantDesc*
